Task Session (5)

Session 5: Calculator Function

Objective: Create a calculator function that performs addition or subtraction based on the input operation type.

Instructions:

1. Define a function `calculator` that takes three arguments: `operationType`, `num1`, and `num2`.

2. Use conditional statements to perform the specified operation.

3. Return the result.

Test Cases:

- Input: `operationType = "Add"`, `num1 = 10`, `num2 = 5`

  Output: 15

- Input: `operationType = "Subtract"`, `num1 = 10`, `num2 = 5`

  Output: 5

- Input: `operationType = "Multiply"`, `num1 = 10`, `num2 = 5`

  Output: "Invalid Operation"
