Task Session (2)

Objective: Explore and apply text styling properties in CSS by creating a webpage with various text effects.

Instructions:

1. HTML Structure:

-Create an HTML page with multiple paragraphs and headings. Use appropriate HTML elements (e.g., `<h1>`, `<h2>`, `<p>`) to structure your content.

2. Text Alignment:

- Demonstrate the use of different `text-align` property values by applying them to paragraphs. Include examples of left, right, center, and justified alignment.

3. Text Decoration:

- Apply various `text-decoration` styles to different parts of the text. Showcase styles such as underline, overline, and line-through. Experiment with combinations of these styles as well.

4. Text Transformation:

- Use the `text-transform` property to demonstrate different transformations like uppercase, lowercase, and capitalize. Apply these transformations to selected text elements.

5. Text Shadow:

- Add creative text shadows to headings and paragraphs. Use different `text-shadow` properties, such as color, offset, blur radius, and spread. Experiment with multiple shadows to see various effects.

<u>Example</u>

THIS TEXT IS ALIGNED TO THE LEFT. AND UPPERCASE TEXT

<div align="center">this text is centered. and lowercase text</div>

<div align="right">This Text Is Aligned To The Right. And Capitalize Text</div>

This is a justified paragraph. The text is spaced out so that each line has equal width, creating a clean edge on both sides of the text block.

This heading has a text shadow.

This paragraph has a text shadow effect.
